

IXcellerate offers to host server racks at differently located data centres on custom terms for your business.

Colocation

IXcellerate Infrastructure specifications

Power Supply

- Hosting of customer infrastructure of any capacity, including high-traffic racks up to **55 kW**.
 - **60+ MW**. Power capacity of IXcellerate's North Campus at full capacity.
 - **380+ MW**. Power capacity of IXcellerate's South Campus at full capacity including the in-house power supply centre to be built.
 - Independent power supply feeds, backed up with standalone transformers, diesel generators and uninterruptible power supply systems.
 - **2N**. Rack-level redundancy. Rack connection via two lines from two independent feeds.
 - **N+1**. DC energy infrastructure redundancy (DGU, UPS and switchgear).
 - Every DC has two independent inputs from a power supply line **10 kV** minimum.
 - DC is guaranteed to remain online thanks to backup supplies such as DGU, which are refuelled every 32 hours at full rated capacity.
- Autonomous operation time: **500 hours**.

Physical security

- **24/7/365** secure grounds.
- Up to **6 levels** of physical security.
- Video surveillance system.

Cooling

- The climatic parameters are **ASHRAE** compliant with the temperature range of + 18-27°C and humidity of 30-80%.
- A compound cooling system is used, which **combines energy-efficient chillers** with freecooling (for server rooms) and multiloop freon systems (for DC infrastructure).
- An innovative **adiabatic air-precooling** system starts up for peak temperatures.
- Depending on the DC involved, there is used:
 - 1 The principle of insulation of hot corridors where air is supplied through **cold walls using the LSV** (low-speed ventilation) process
 - 2 A conventional system for cold-air supply from under the **raised flooring**.
- **N+1**. Cooling system redundancy
- All pipelines are protected by a leak detection system.

- Gateways, buffer zones and physical enclosure/insulation of customer area upon request.
- Strict authorization and access control procedures as per **PCI DSS**.

Fire safety

- Automatic fire alarm system.
- Public address and evacuation system.
- Early-warning air-sampling fire detection system.
- Automatic fire protection system.
- Mobile localized fire extinguishing.

IXcellerate's data centres use two types of automatic fire suppression systems:

- A gaseous fire suppression system based on **NOVEC 1230**
- A high-pressure water mist (HPWM) system, which uses distilled-water mist generated under high pressure through a zoned sprinkler system as an extinguishing agent.

Both systems have all RF certificates of conformity and fire safety certificates.

Choose a solution

Scalability from 1 rack to a dedicated server room 500 + racks

Rack unit

Server hardware can be hosted at Tier III data centres within the grounds of the South and North Campuses.

Dedicated area

Hardware can be hosted in a dedicated area within a server room, in a physical enclosure with a private access.

Server room

Hardware can be hosted in a dedicated space with a custom physical security system as well as bespoke access control solutions.

Several server rooms within a campus

Hardware can be hosted in several rooms allocated within a campus.

North Campus (MOS 3, reservation)
South Campus (MOS 5, operation; MOS 6, MOS 7 and MOS 8, reservation).

Any hosting option can have capacity reserved in IXcellerate's two campuses at different locations

The specifications listed in the brochure are tentative and can be revised.

Certificates

IXcellerate's data centres are designed to **Tier III** standards. Guaranteed availability and accessibility of all DC infrastructure components: **99.982%**. The company is regularly audited and recertified for conformity to ISO and PCI DSS international standards.

PCI DSS v.3.2.1
